Allsheets, Inc releases Allsheets Program Tracker & Allsheets AutoCAD® Tracker

Both Program Tracker products are used to keep track of the time spent in different software applications for the purpose of financial accounting, and project management on PC's. They enable the user to track time spent in any array of applications. Allsheets Program Tracker & Allsheets AutoCAD® Tracker are linked with Quickbooks 2002, and able to generate invoices. Convenient user-definable idle mode make sure that only actual work time is invoiced

Allsheets AutoCAD® Tracker is specifically designed with the AutoCAD user in mind. Keeping track of time spent in AutoCAD drawings has never been easier. Allsheets AutoCAD® Tracker keeps track of hours in unlimited numbers of drawings.

When any application is opened, the Program Tracker prompts the user to turn on the tracking information. If the tracker is selected, the user will be able to choose the customer for billing along with an assigned project. Projects consist of collections of tracked programs. Once a project is opened, it is possible to assign unlimited programs to it. When the user closes a program, and/or selected drawing, the tracking on that specific program stops and is logged in the database. Time is tracked on a program only if that program is in actual use - the User Idle Time feature allows the user to leave the computer without worrying about adding unproductive time to an account.

When a project is finished an invoice can be generated in QuickBooks 2002 without leaving Program Tracker. Clicking on the "Generate Invoice" button in the Program Tracker window will prompt the user to assign inventory items, (imported automatically from QuickBooks 2002), and finalize the invoice total for printing.

Allsheets Invoicing software can be added to the Program Tracker for non QuickBooks 2002 users (to be released Q2, 2002).

User Example:

I use "Microsoft Word" and "Microsoft Access" in my every day work. Today I am building a Word document as well as an Access database to generate a Mail Merge

for my customer John Smith. When I open "Microsoft Word", the "Program Tracker" alert buttons "Yes" and "No", for tracking, appear. I click "Yes".

The "Bill To Information" dialog box appears next, and can be filled with the project and customer information. The customer is selected, and the project is created and associated with the customer. All time generated while tracking the "Word" document will be added to this project. I open up my "Microsoft Access" database next. Again the "Program Tracker" prompts for a "Yes" or "No" to track the program. I select "Yes", and when the "Bill To Information" dialog appears I click on the former project and the customer information is automatically filled in.

When I am finished with the two programs, I can generate an invoice for Mr. Smith by clicking the "Generate Invoice" button. All the programs that are associated with this project are compiled on the "Invoice" form. The "Invoice" form shows the total time to invoice as well as the hourly wage that we have assigned to this customer. The invoice can then be printed and mailed to Mr. Smith. If I plan on working on something like this for Mr. Smith on a regular basis, I can keep the project active and assign more programs to it in the future.

#### System Requirements

50MB HD Space

64MB RAM

Pentium Class (or better) processor at 233MHz or better

QuickBooks 2002 required for invoicing
